Tamper Protection for Datto EDR and Datto AV

Cybercriminals are sophisticated, and one of their first moves is to disable endpoint security before launching an attack. Threat actors specifically target endpoint detection and response (EDR) and antivirus (AV) solutions, attempting to shut them down or alter their functionality to slip past defenses undetected. Tamper protection is an essential feature, and without it, organizations risk losing their first line of defense, leaving endpoints exposed to ransomware, malware and other cyberthreats.

Keeping Your Endpoint Security Active

Datto EDR and Datto AV's Tamper Protection safeguards critical components of our solution, ensuring that malicious actors cannot disable, alter or disrupt its operations. It acts as a shield, preventing unauthorized changes to files, processes, services and registry keys that are essential for your security.

Datto EDR and Datto AV work together to ensure maximum protection:

- **Protected Processes:** Core components, such as the EDR agent and AV services, are secured from termination or tampering.

- **Registry Defense:** Key system settings related to EDR and AV are locked against unauthorized modifications.

- **File Integrity:** Critical files, including configuration files, are shielded from deletion or unauthorized changes.

A Stronger Security Posture

By having and enabling tamper protection, you're taking a proactive step to bolster your organization's defense against attacks that aim to disable or bypass your security measures. This added layer of protection ensures that Datto EDR and AV remain resilient, giving you peace of mind while providing continuous and reliable security for your endpoints.

Take control of your security today. Enable EDR Tamper Protection alongside Datto AV and experience the confidence of knowing your critical systems are protected against tampering and disruptions.
