

BACKUP

Versus

BUSINESS CONTINUITY

The Difference Between Uptime and Costly Downtime

Downtime is real, and it's costly. It's critical for all organizations, regardless of size, to both protect their data and make sure they can get back to business rapidly after a disaster or other event that compromises their data and systems.

This Executive Brief will discuss what's at stake when it comes to the value and protection of your data, and the next steps in terms of "business continuity" rather than simply data backup. And when looking at business continuity, we'll discuss the key roles of Recovery Time Objective (RTO) and Recovery Point Objective (RPO), so that you can get what you need from your business continuity vendor.

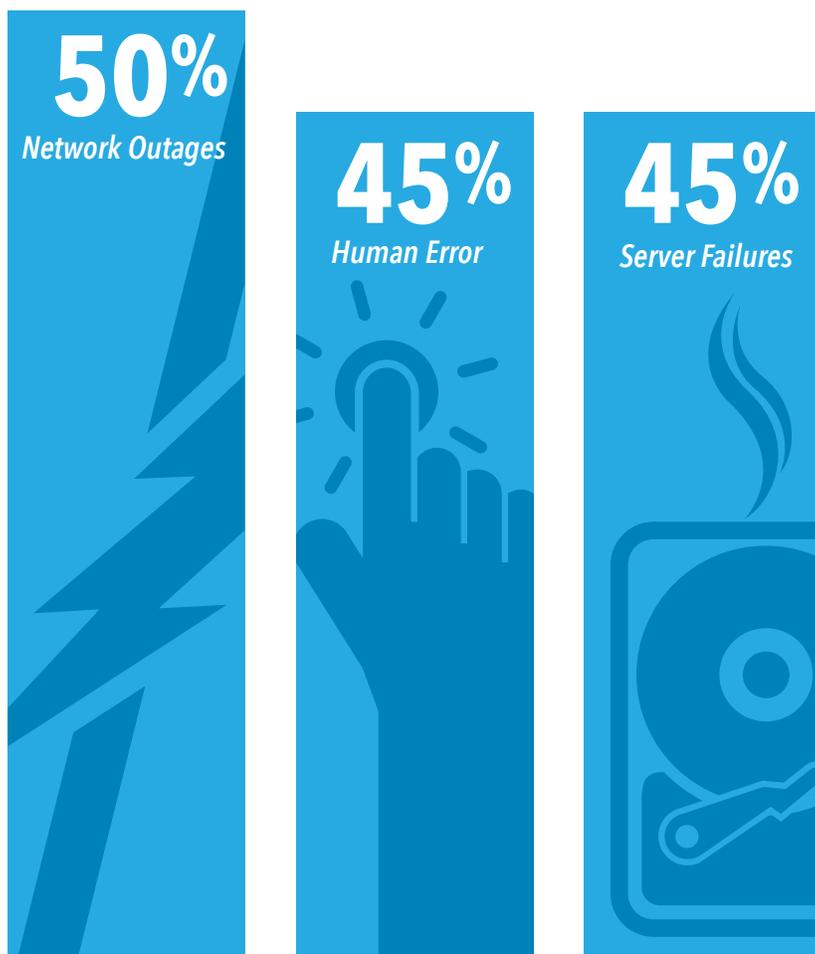

Figure 1: Reasons for Downtime

Cost of Downtime

Downtime costs a staggering \$163,674 per hour, according to research by the Aberdeen Group.¹ Of course, the exact cost depend on company size, less for small companies and more for larger. The numbers speak for themselves: you need to plan for downtime.

Causes of Downtime

As it turns out, businesses should be more wary of their own employees than of natural disasters. Although hurricanes, tornadoes, and the like do their fair share of damage, research shows that natural disasters account for just 10 percent of downtime.² The leading culprits? Network outages and human error. (See Figure 1.) And when you look at the cause of downtime by data volume alone, the No. 1 culprit is human error, at 58 percent. Wow! (See Figure 2.)³

What's at Stake?

Two-and-a-half quintillion bytes of data are generated daily. And 90 percent of the total data in existence was created within the last two years.⁴ Consider all the servers, desktops, and laptops that the typical business must manage. It all adds up to a lot of data to protect.

A staggering 75 percent of SMBs possess no disaster recovery plan, and only 25 percent are "extremely confident" that they can restore data in the case of an event that destroys their data.⁵ And 50 percent of SMBs back up less than 60 percent of their data. The remaining 40 percent? No protection whatsoever.⁶

How much does this cost? Plenty. Thirty-five percent of SMBs lost as much as \$500,000 over the past three years due to downtime. Five percent lost up to \$1 million. And three percent lost more than \$1 million.⁷ (See Figure 3.)

When Disaster Strikes

When disaster strikes, businesses must scramble. And the clock is ticking while they attempt to retrieve important data. According to IDC, it takes, on average, seven hours to resume normal operations after a data loss incident, with 18 percent of IT managers saying that it takes 11 to 24 hours, or even longer.⁸

The Aberdeen Group came up with comparable numbers when it compared best-in-class companies with average and "laggards" in the matter of data back-ups. Multiply even the average amount of time it takes to recover from a downtime event (5.18 hours) times the average cost of downtime, and you've got a whopping bill to pay by any standard. (See Figure 4.)

Small wonder that 40 percent of all businesses close their doors permanently after a disaster, according to the Federal Emergency Management Agency (FEMA). Similar statistics from the U.S. Small Business Administration (SBA) indicate that more than 90 percent of businesses fail within two years after being struck by a disaster.

	"Large-Volume Data" sites	All others
Network outages	42%	53%
Human Errors	58%	44%
Server failures	44%	46%
Storage failures	45%	44%
Application errors	37%	33%
Power outages	13%	28%
Usage spikes/surges	19%	15%

Figure 2: Downtime by data volume

	< 1,000	1,000 to 10,000	> 10,000
No costs incurred	17%	20%	8%
< \$500,000	35%	39%	29%
Between \$500,000 and \$1 million	5%	9%	8%
> \$1 million	3%	3%	10%
Don't know/unsure	24%	29%	46%

Figure 3: Total cost of downtime

	<i>Best in Class</i>	<i>Average</i>	<i>Laggard</i>
<i>Number of downtime incidents in past 12 months</i>	0.56	2.26	3.92
<i>Average amount of downtime per event in last 12 months</i>	0.16 hrs.	1.49 hrs.	17.82 hrs.
<i>Longest downtime event</i>	0.21 hrs.	4.78 hrs.	43.71 hrs.
<i>Critical application availability</i>	99.90%	99.62%	99.58%
<i>Length of time to recover from last downtime event</i>	1.13 hrs.	5.18 hrs.	27.11 hrs.

Figure 4: Downtime figures for SMBs in the case of data loss

What are SMBs doing to protect themselves? Sixty-one percent still ship tapes off to a storage facility or another office—a surprising number, considering that this is a technology that is more than four decades old, and the processes for saving data to tape, removing it to a remote location, and retrieving it in case recovery is needed are extremely cumbersome. Thirteen percent don't do anything at all. But, interestingly enough, 19 percent are already using some sort of cloud-based data backup.¹⁰

Traditional Backup vs. Business Continuity

Although overlapping, these terms represent uniquely different mindsets when it comes to data protection.

Data backup answers the questions: is my data safe?
Can I get it back in case of a failure?

Business continuity, on the other hand, involves thinking about the business at a higher level, and asks: how quickly can I get my business operating again in case of system failure?

Data backup is a good first step. But in case of failure, you have to get that data back and restore it quickly enough so your business doesn't suffer. For example, if your server dies—and remember, hardware failure is the No. 1 cause of lost data—you wouldn't be able to quickly get back to work if you only had file-level backup. For you to start working again, your server would need to be replaced, all software re-installed, data re-installed and then the whole system would need to be configured with your settings and preferences. This process could take hours or even days—and in the meantime, your users can't get their jobs done.

If you've planned for business continuity, however, you've thought of all these things. You've thought in terms of Recovery Time Objective (RTO), and Recovery Point Objective (RPO).

RTO (Recovery Time Objective): The duration of time within which a business must be restored after a disaster or disruption to avoid unacceptable consequences associated with a break in business continuity.

RPO (Recovery Point Objective): The maximum tolerable period of time in which data might be lost due to a disaster.

By calculating your desired RTO, you have determined the maximum time that you can be without your data before your business gets into serious trouble. Alternatively, by specifying the RPO, you know how often you need to perform backups, because you know how much data you can afford to lose without damaging your business. You may have an RTO of a day, and an RPO of an hour. Or your RTO might be measured in hours and your RPO in minutes. It's all up to you and what your business requires. But calculating these numbers will help you understand what type of data backup solution you need (See Figure 5).

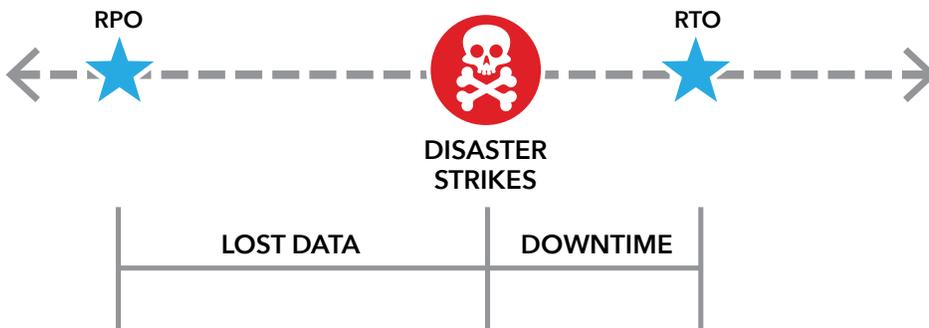

Figure 5: The difference between RPO and RTO

Once you determine your RPO and RTO, it's time to calculate how much downtime and lost data will actually cost you. Add the average per-hour wage, the per-hour overhead, and the per-hour revenue numbers and you have how much a data loss will cost you:

- How many employees would be affected if critical data were unavailable?
- What is the average wage of the affected employee (per hour)?
- What is the per-hour overhead cost of the affected employees?
- How much revenue would be lost per hour as a result of the unavailability of data?

Given that funding and budget constraints can be the top challenge (43 percent) for a business to implement a business continuity solution, calculating your RTO will give you the financial validation needed to justify its purchase and maintenance.¹⁰ Calculating the real costs associated with data loss gives SMBs a better understanding of the risks relating to business failure.

What to Look for in a Business Continuity Vendor

When comparing vendors for a backup solution, SMBs say that reliability (33 percent) and price (29 percent) top the list of factors that drive their choices. But

Image Versus File-Only Backup for Business Continuity

There are two well-known types of backup solutions: file- and image-based. A file-based backup does exactly what it sounds like: you choose which files you want to back up, and those files are saved, to an on-site device or to the cloud, whichever type of solution you have chosen. But only the files you choose are saved. What if you forget to save a key file?

Image-based backup, on the other hand, captures an image of your data in its environment. Thus you have exact replications of what is stored on a server—including the operating system, all configurations and settings, and your preferences. If a server goes down, you can restore it in seconds or minutes, rather than the hours or days it would take to requisition a new server, and install and configure the operating system.

here are five key fundamentals that must be inherent in a viable solution:

1. Superior RTO and RPO—Think in terms of business continuity rather than simply backup, and calculate how much downtime your business can endure and still survive (RTO) as well as how much data you can afford to lose (RPO). Choose a vendor that can guarantee top RTOs and RPOs.
2. Hybrid cloud backup—A hybrid approach fixes the vulnerabilities that a cloud-only or local-only possess.
3. Image-based backup—Make sure that the backup solution takes images of all your data and systems, and doesn't simply copy the files alone.
4. Instant local and off-site virtualization. Time is money.
5. Screenshot backup verification. What good is a backup if it's not working? Demand proof.

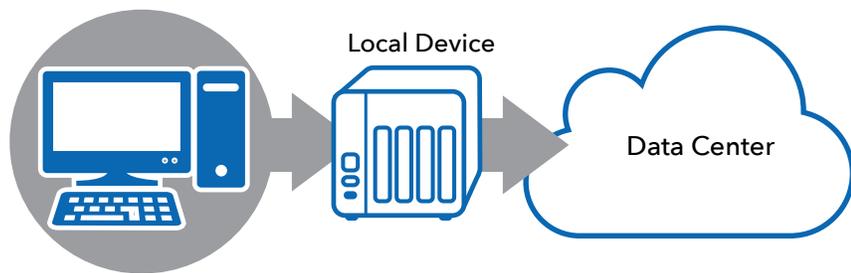

Figure 6: Hybrid Cloud

Conclusion

The ability for a business to continue operating in case of a disaster is a unified goal for both business and IT, and is just as essential to SMBs as it is to the largest enterprises.

Datto is a technology leader and solution innovator that offers a broad range of business continuity and storage solutions, including hybrid-cloud solutions. Having a full suite of solutions enables our more than 8,000 channel partners worldwide to sell their services into businesses of all sizes, helping them open new markets and opportunities. Our No. 1 priority is to provide our channel partners with best-in-class solutions based on superior technology and award-winning support, to help our partners grow their businesses. Learn more at dattobackup.com.

Local or cloud backup? The answer lies in between

Using local backup for business continuity works well for quick restores. Because the data is right there, it's fast and easy to restore back to its original location and keep the business humming. But what happens if the power goes out? If the device fails? Or if it is stolen or destroyed in a natural or man-made disaster? You might think the cloud looks more attractive for all these reasons. But cloud-only backup is risky because you can't control the bandwidth. Restores tend to be difficult and time-consuming. After all, the cloud can fail, too.

The answer? A hybrid-cloud solution. The way this works: your data is first copied and stored on a local device. That way, if something happens, you can do a fast and easy restore from that device. But then your data is also replicated in the cloud. So if anything happens to that device, you've got off-site cloud copies of your data—without having to worry about moving copies of your data off-site physically. (See Figure 6)
